SUMMARY

Full-stack engineer (UCLA Data Science '27) who ships user-facing products on serverless AWS infrastructure. Built and deployed a multi-service app — React/TypeScript frontend, Lambda/API Gateway/RDS backend — with all infrastructure defined as code in AWS CDK and architected to run under \$0.30/month. Pursuing AWS Certified Solutions Architect – Associate (exam Aug 2026).

TECHNICAL SKILLS

Cloud & Infrastructure: AWS (Lambda, API Gateway, S3, RDS, EC2, IAM, VPC, Cognito, CloudFront, CloudWatch, DynamoDB, SSM), AWS CDK, boto3, serverless architecture, cloud cost optimization

Delivery & Automation: Git, GitHub Actions, CI/CD, Docker, Bash/Shell scripting, Terraform

Frontend & Product: React, TypeScript, JavaScript, REST API design, JWT auth flows, responsive UI

Languages & Data: Python, SQL, TypeScript, C++, R • PostgreSQL, Supabase, DynamoDB, relational schema design • pandas, NumPy, matplotlib

PROJECTS

Plak — Full-Stack Serverless Activity-Ranking App

React • TypeScript • AWS CDK

- Designed and deployed a full-stack serverless app on AWS (Lambda, API Gateway, RDS Postgres, Cognito, S3, CloudFront) with all infrastructure defined as code via AWS CDK — implementing VPC networking, JWT-authorized routes, S3 presigned URL uploads, and a binary-search ranking algorithm ($O(\log n)$) across a secure multi-tenant Postgres data model
- Architected for cost at <\$0.30/month by replacing a \$32/month NAT Gateway with a VPC Gateway Endpoint, choosing serverless compute over EC2, and leveraging free-tier coverage — diagnosing a Lambda timeout traced to the missing S3 network path as part of the optimization
- Built a GitHub Actions CI/CD pipeline: lint → unit tests → CDK diff → staged deploy with smoke tests and rollback on failed health checks

Archive Us — Private Media Archive on AWS

PostgreSQL • S3 • Cognito • CDK

- Designed a relational schema on PostgreSQL modeling time-based entries and user relationships for a private shared archive with scoped, object-level access control
- Built an upload-and-retrieval pipeline for large video files using S3 presigned URLs with structured metadata in the relational backend
- Migrated the stack from Supabase to AWS (RDS, S3, Cognito) deployed via CDK, including schema export, cutover, and least-privilege IAM policies

Tempo — Adaptive Task Scheduler

Python • pandas • React

- Implemented a weighted scoring algorithm in Python to rank and prioritize tasks using features including energy level, task difficulty, duration, and deadline proximity.
- Processed behavioral datasets with pandas (planned vs. actual duration, completion outcomes) to identify temporal productivity patterns.
- Built feedback-driven rescheduling logic that adjusts task ordering based on prior completion behavior and user context.
- Built a web UI with a drag-to-reorder daily plan and visible “why this order” score explanations

EXPERIENCE

Founder - Euphony

April 2023 – May 2025

- Designed a time-series schema and feature-extraction pipeline for physiological sensor data; ran controlled stimulus-response experiments (sound frequency, light exposure) to test measurable user-state impact
- Built multi-variable data models (time, stimulus type, user feedback) enabling structured analysis of behavioral pattern

Project Intern — Cho&CO

Feb 2023 – August 2023

- Conducted competitive and audience analysis to identify market positioning gaps, producing findings that informed brand strategy and drove design consistency across [10]+ deliverables.
-

Certification

AWS Certified Solutions Architect - Associate

Expected August 2026

EDUCATION

University of California, Los Angeles

Expected June 2027

B.S. in Data Science — Los Angeles, CA

- *Relevant coursework:* Data Structures, Probability, Real Analysis, Linear Algebra, Linear Regression
